MASTER'S PHYSICS THESIS

Evolution of Quantum Open System under Continuous Measurement

Keywords:

Stochastic Master Equation
Quantum Trajectories
Photodetection
Homodyne detection

STUDENT:
Jules STEVENOT

SUPERVISOR:
Bruno BELLOMO

Januray-June 2026

ACKNOWLEDGEMENTS

The author expresses deep gratitude to Bruno Bellomo for his guidance and support throughout this research. He is a man who always took the time to explore ideas, ensure our understanding, and seek details. His expertise in Quantum Mechanics has been fundamental to the successful completion of this Master's thesis. I am grateful to conclude my short career as a physicist with such a demanding and rewarding journey, thanks to Bruno.

I would like to thank the members of the jury for their time and interest in this work, as well as for the opportunity to present my work in front of such esteemed peers. I also would like to thank my colleagues for their insightful discussions and moral support during this adventure: Silvio Da Silva, Jana El Badawi, Anjana Mohan, and Léo Jacquerot-Legros for welcoming me into your office. Thank you in particular for your time and the discussions we had, which greatly helped me.

Finally, I would like to thank my friends and family for their never-ending support and love: Erwan Le Dœuff, Titouan Alphonse, and Nabyan Arkan for these two years of Master's studies and friendship together; Maxence Bonin for being there like a brother when difficulties arose; my parents Catherine and Lionel for my entire life and education; my brother Pierre for his righteousness and compassion; and finally my other half, without whom I would not be who I am today, Alexiane.

L'auteur exprime sa profonde gratitude à Bruno Bellomo pour ses conseils et son soutien tout au long de cette recherche. C'est quelqu'un qui sait prendre le temps d'explorer des idées, de s'assurer de notre compréhension et de rechercher les détails. Son expertise en mécanique quantique a été fondamentale pour la réussite de ce mémoire de Master. Je suis reconnaissant de conclure mon court parcours de physicien par une aventure aussi exigeante et gratifiante, grâce à Bruno.

Je tiens à remercier les membres du jury pour le temps qu'ils ont consacré à ce travail et pour l'intérêt qu'ils lui ont porté, ainsi que pour l'opportunité de présenter mes travaux devant des pairs reconnus. Je souhaite également remercier mes collègues pour leurs discussions enrichissantes et leur soutien moral au cours de cette aventure : Silvio Da Silva, Jana El Badawi, Anjana Mohan et Léo Jacquerot-Legros pour m'avoir accueilli dans leur bureau. Je vous remercie tout particulièrement pour votre temps et pour les discussions que nous avons eues, qui m'ont grandement aidé.

Enfin, je tiens à remercier mes amis et ma famille pour leur soutien et leur amour indéfectibles : Erwan Le Dœuff, Titouan Alphonse et Nabyan Arkan pour ces deux années d'études de Master et notre amitié partagée ; Maxence Bonin pour avoir été comme un frère lorsque les difficultés sont survenues ; mes parents, Catherine et Lionel, pour toute ma vie et mon éducation ; mon frère Pierre pour sa droiture et sa compassion ; et enfin ma moitié, sans qui je ne serais pas ce que je suis aujourd'hui, Alexiane.

« La gloire de Dieu, c'est de cacher les choses; La gloire des rois, c'est de sonder les choses. »

I Theory of open quantum systems and continuous measurements

I.i) Introduction and motivations

The paper you read will read is purposely non-exhaustive ; it consists of a pedagogical and demonstrative introduction to *quantum continuous measurements*. Talented searchers made thorough and detailed papers on the subjects we will tackle, but we wanted to allow mere students or uninitiated people to understand the basics of weak measurements.

Quantum mechanics is the most fundamental physical theory humankind has developed due to accurate description at the smallest scale of the Universe. The primary results of quantum physics are obtained while considering a system isolated in the void from any perturbation or interaction. However, it seems trivial that any real physical system is "feeling" its surroundings (light rays or magnetic field hitting the system, coupling with a cavity, etc...) thus we ought to describe the impact of the environment on a system ; the couple System-Environment is called as *Open* Quantum System (OQS). Before diving more into this theory we should describe what we call a measurement [1, 2], the postulate of quantum measurement states that we can choose any basis to represent a system, living mathematically in an Hilbert space, $|\psi\rangle \in \mathcal{H}$:

$$|\psi\rangle = \sum_n c_n |\phi_n\rangle \quad ; \; c_n \in \mathbb{C}$$

We can look at which eigen-state $|\phi_n\rangle$ the system is in, doing so will (always) put the system in one of these states and we know the probability to get this state: $|c_n|^2$. This kind of measurement is called a *von Neumann measurement* where the result is a state among the set of eigen-states. Formally, it is a Projection-Valued Measurement (PVM) where the projector associated with the probability to find the result n is $\mathbb{P}_n = \langle\psi| P_n |\psi\rangle$. More general *quantum measurement* or Positive-Operator Valued Measures (POVM) Π_n can be defined by $\mathbb{P}_n = \mathrm{Tr}\left[\rho\Pi_n\right]$ where we use a generalization of quantum states into density matrix ρ, which for pure states is $\rho_{pure} = |\psi\rangle\langle\psi|$. This new formalism of density matrix has importance revealed when dealing with OQS, please find Appendix A for further understanding.

I.iii) Obtaining Stochastic Master Equations (SME)

A Quantum Measurement Theory

The introduction about measurement theory in I.i) and this appendix have been constructed from the work of *K.Jacobs* [1] and *H.M.Wiseman* [2].
